For Week 5, I continued configuring Windows Server 2025 using Pluralsight Cloud Servers through Remote Desktop.

Operating System Configuration

I accessed the Display Settings but couldn't change the display resolution because it was restricted during the remote session. I also checked the Power Settings and confirmed that the Balanced power plan was active. The display timeout was set to Never, and the advanced settings were grayed out, so I kept the existing configuration.

For Accessibility Settings, I adjusted the text size to improve readability while using Remote Desktop.

User Account and Password Configuration

I created a local user account named **capstone_week5**, with the full name **User1**, using Local Users and Groups in Windows Server 2025.

I also reviewed the password policy through Local Security Policy, confirming that password complexity was enabled and the maximum password age was set to 42 days.

Application Installation and Configuration

I successfully installed three applications: Google Chrome, Notepad++, and 7-Zip.

Google Chrome: Changed the startup settings to automatically open Google for quick access to online searches.

Notepad++: Enabled Word Wrap to make long lines of text easier to read.

7-Zip: Enabled Show Grid Lines to make files easier to distinguish and organize.
